Summary

Senior Backend Engineer with 4+ years of production experience building scalable, mission-critical systems using TypeScript and Node.js. Proven track record in financial infrastructure, payment systems, and distributed architectures at NetApp and Anchanto.

Skills

Core Language & Runtime

JavaScript | TypeScript | Node.js

Familiar & Secondary

Golang | Python | Rust | Java

Library / Frameworks

Nest.js | Express.js | Fastify | Jest | Next.js | React.js

Database

MySQL | MongoDB | PostgreSQL

Tools

Kibana | Grafana | Signoz | Docker | K8s | Dynatrace | Teamcity | Jenkins | n8n | Helm

Cloud Infra

AWS | Supabase | Vultr | Hetzner

Messaging Systems

Apache Kafka | Rabbit MQ | Redis (Distributed Cache)

AWS Systems

RDS | Dynamo DB | CloudWatch | Lambda | S3 | EC2 | ECS | ECR | SQS | EKS

Work Experience

1. NetApp India Pvt Ltd., Bangalore, India [BlueXP Digital Wallet]

September 2023 - Present

Subject Matter Expert (SME) for License and Charging – NetApp Console's two primary revenue-generating services, supporting SAAS and isolated/air-gapped (NCL / Dark-Site) deployments.

 - Recovered \$1M+ in previously unbilled revenue in Q1 FY24-25 by designing and shipping a backend back-charging engine (Vanilla JS) that identifies and retroactively bills uncharged customer usage windows.
 - Reduced production charging errors and incidents by 12% by building a charging-alert investigation service that automates root-cause detection for billing failures.
 - Increased team-wide operational efficiency by 52% YoY by building a self-service revenue-loss calculator that automated the manual process of quantifying over/under-charging per customer.
 - Led a 4-engineer cross-functional team to design and ship an end-to-end AI chat application for charging investigations, from HLD through deployment, using NestJS, Next.js, and the OpenAI SDK, deployed via GitHub Actions CI/CD to internal infrastructure.
 - Designed and scaled distributed billing systems handling customer transactions across microservices architecture.
 - Expanded analytics data coverage by integrating the newly launched tenancy-v4 service with the platform reporting pipeline, feeding additional data into SQL-based reporting.
 - Automated daily data integrity checks by introducing TeamCity pipelines to run charging-alert investigation and tenancy-v4 integration jobs on a recurring schedule.
 - Gave customers self-service control over billing routing by designing and shipping a billing-preference API (Node.js, Fastify) allowing customers to select which marketplace subscription-ID they're billed under.
2. NetApp India Pvt Ltd., Bangalore, India [Marketplace Control Tower]

January 2026 - Present

- Cut AI-assisted root-cause investigation time for billing anomalies by building a Node.js MCP (Model Context Protocol) server that exposes production and analytics DB data directly to LLMs, enabling automated anomaly diagnosis instead of manual log-diving.
 - Enabled reuse of license-service infrastructure across multiple product teams by upgrading its Helm chart into a shared microservice and setting up a Jenkins pipeline for teams to self-serve image pulls and deploy independently into their own Kubernetes clusters.
 - Contributing core architecture and engineering design for NetApp's Marketplace Control Tower platform (Go, Temporal, Dynatrace) as part of the founding engineering team.
 - Ensured compliance and reliability in financial systems processing sensitive subscription and billing data
3. Anchanto Services Pvt. Ltd, Singapore [Order & Warehouse management, Parcel tracking systems] [Backend]

Jan 2022 - August 2023

- 1.5+ years building backend systems for order management and parcel tracking using Node.js, Express, REST APIs and asynchronous integrations
 - Implemented Retry-logics, increased logging throughput and improved schedulers which outpaced the server performance by 28%.
 - Integrated Anchanto product service OMS with more than 8 marketplaces and carriers like Haravan (Vietnam), Quipup (UAE), Salla (UAE), Shopee (Korea), Grabmart, JD.com (Thailand) etc, via asynchronous REST/SOAP APIs/Plug-ins which increased the scalability and broadened the product's horizon and supported go-live and UAT projects for 8 different integration projects..

Open source contributions

1. Postiz App AI-Driven Social Media Scheduling Tool (35K+ GitHub Stars)

January 2024

- [Short.io Integration Provider](#) | [PR #564 \(Merged\)](#)
- Designed and implemented a new short-linking provider for Postiz's multi-provider architecture, enabling users to leverage Short.io's URL shortening capabilities within the social media scheduling platform.
- Architected provider pattern implementation using **NestJS**, following **SOLID principles** for extensibility and maintainability across multiple short-linking services (**Dub**, **Short.io**, etc.).
- Implemented core methods: link statistics retrieval, URL shortening/expansion, and recursive pagination logic for bulk link analytics across the platform.
- Integrated **Short.io API (REST)** with proper error handling, **authentication (Bearer token)**, and response mapping for production-grade reliability.
- Code review approved and merged by maintainer [@nevo-david](#); integrated into active codebase serving thousands of social media managers.
- **Tech Stack:** TypeScript, NestJS, REST APIs, Design Patterns, Git/GitHub

Personal Projects

1. Multi-Broker Algorithmic Trading Automation

August 2023 - Present

- **Status:** Daily live trading | Deployed In Production
- **Brokers:** Dhaan (live), Angel/Fyers/Zerodha (architecture-ready)
- **Autonomous trading automation platform:** receives **TradingView webhooks + WhatsApp/Telegram signals** → **evaluates trading strategies against live market data** → **executes orders across multiple brokers** → **logs all activity. Runs 24/7 in production with zero manual intervention**
- **Multi-broker architecture:** Factory pattern + broker-agnostic interfaces enable plug-and-play broker integrations. **Dhaan fully live; Angel, Fyers, Zerodha** ready for activation without code changes.
- **Strategy evaluation engine:** Two-tier filter + conflict resolution system. Evaluates technical indicators (**RSI, Bollinger Bands, VWAP, gap-up, candle patterns**) **across live + historical candles (5-min to 1-month)**. Conflict resolver picks SELL over BUY; execution mode honors score/priority/multi-order settings.
- **Production resilience:** Retry logic with exponential backoff, broker-level trading locks, **global kill-switches**, encrypted credential storage (domain-scoped keys), **MySQL** persistence with **TypeORM** migrations.
- **Deployment pipeline:** Docker containerization, GitHub Actions CI/CD (auto-build to Docker Hub), server-side auto-deploy with health-checks + rollback, SSL/nginx hardening, structured logging + error tracking.
- **Async safety:** 5+ scheduled jobs (broker sync, sell-watch evaluation, metrics) with automatic error catching — zero unhandled rejections.
- **Impact:**
 - ✓ **Daily live trading with real capital**
 - ✓ **100% autonomous (no manual trades)**
 - ✓ **Multi-broker capable (ready to scale)**
 - ✓ **Enterprise-grade error handling + observability**
 -
- **Tech Stack:** NestJS 11, TypeScript, MySQL, TypeORM, Fyers API, Docker, GitHub Actions, Cron scheduling, Docker Hub, Vultr, Redis, Nginx, Hetzner
